- The geography of India is extremely diverse, with landscape ranging from snow-capped mountain ranges to deserts, plains, hills and plateaus. India comprises most of the Indian subcontinent situated on the Indian Plate, the northerly portion of the Indo-Australian Plate.

- India lies on the Indian Plate, the northern part of the Indo-Australian Plate, whose continental crust forms the Indian subcontinent. The country is situated north of the equator between 8°4' north to 37°6' north latitude and 68°7' east to 97°25' east longitude.

- On the south, India projects into and is bounded by the Indian Ocean—in particular, by the Arabian Sea on the west, the Lakshadweep Sea to the southwest, the Bay of Bengal on the east, and the Indian Ocean proper to the south. The Palk Strait and Gulf of Mannar separate India from Sri Lanka to its immediate southeast, and the Maldives are some 125 kilometers (78 mi) to the south of India's Lakshadweep Islands across the Eight Degree Channel.

- India's Andaman and Nicobar Islands, some 1,200 kilometers (750 mi) southeast of the mainland, share maritime borders with Myanmar, Thailand and Indonesia.
- Kanyakumari at 8°4'41"N and 77°55'230"E is the southernmost tip of the Indian mainland, while the southernmost point in India is Indira Point on Great Nicobar Island.

- The northernmost point which is under Indian administration is Indira Col, Siachen Glacier. India's territorial waters extend into the sea to a distance of 12 nautical miles (13.8 mi; 22.2 km) from the coast baseline.

- India has the 18th largest Exclusive Economic Zone of 2,305,143 km2 (890,021 sq mi).

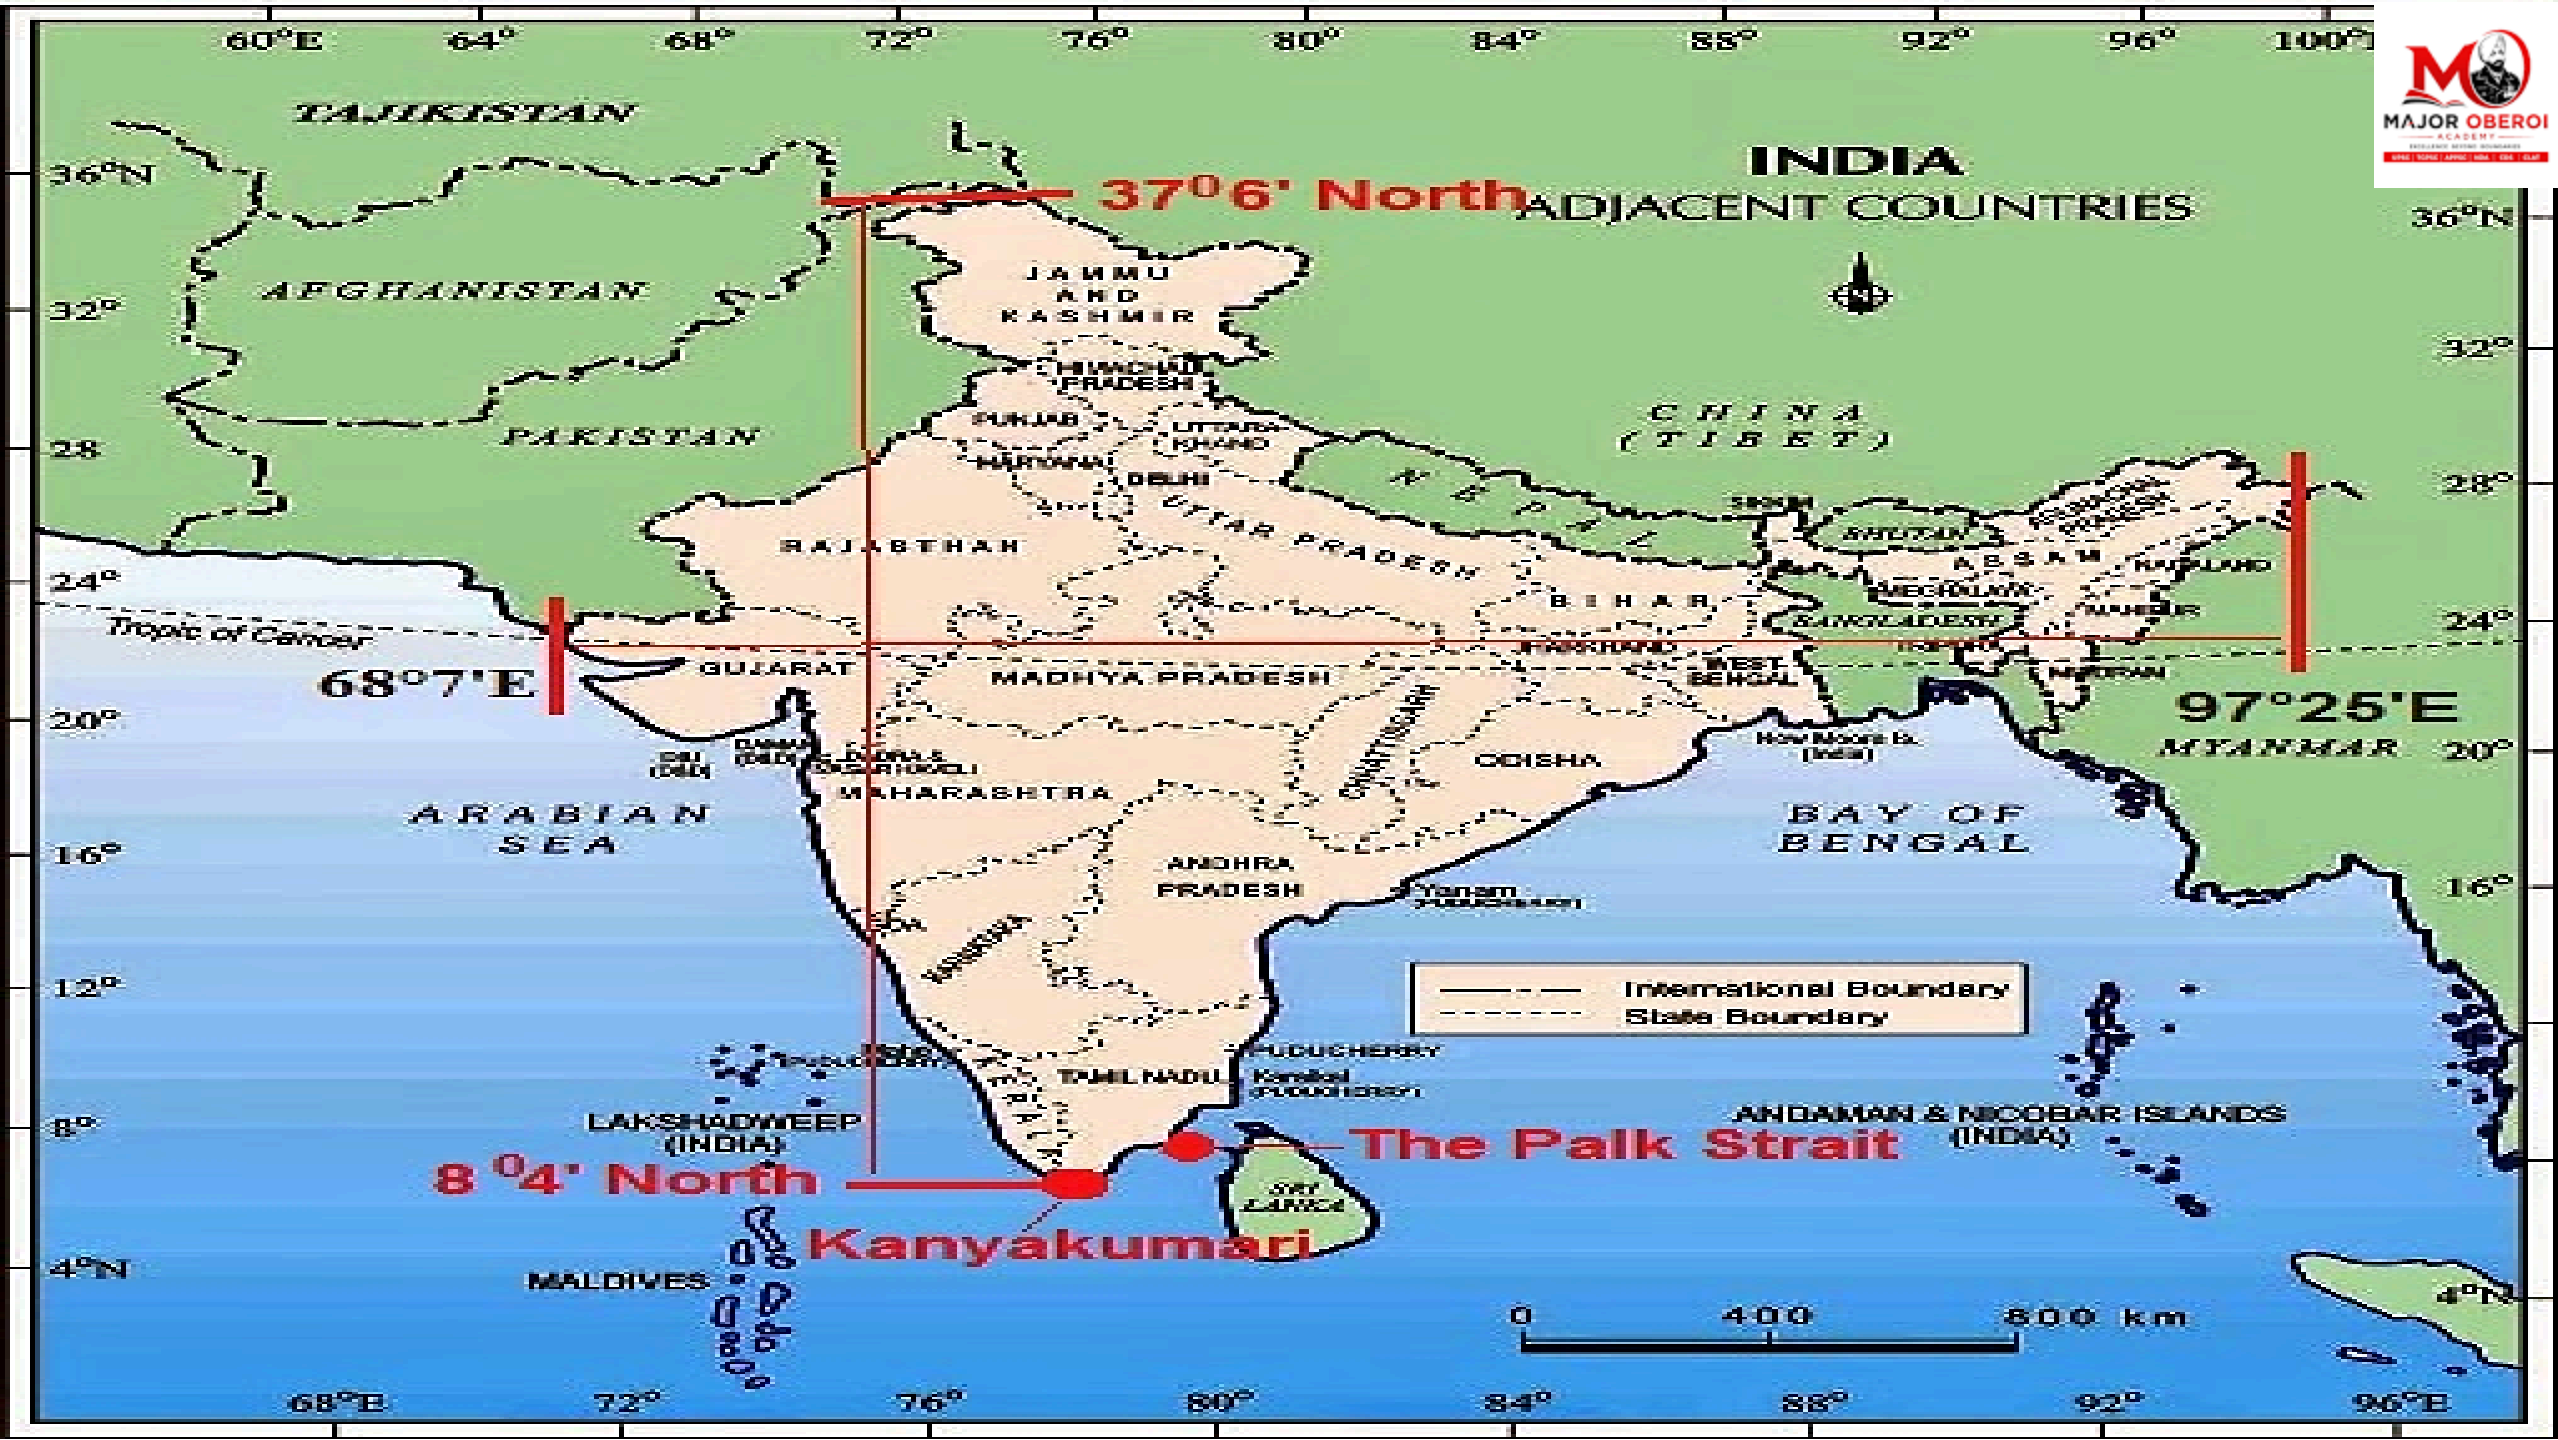

India General Facts

Feature	Description
Area	3.28 million km², which is 2.4% of the world's total area.
Length (N.S.)	3214 kms
Width (E-W)	2933 kms

Length of Land Frontier	15200 kms
Length of Coast Line	7516.6 kms
Main land	5422.6 Kms
Island Territories	2094 kms

Indian Standard Meridian	82½° E longitude, which passes through Naini near Allahabad.
Tropic of Cancer	23½° N latitude, which passes through 8 states: viz. Gujarat, Rajasthan, Madhya Pradesh, Chhattisgarh, Jharkhand, West Bengal, Tripura & Mizoram.

- The northern frontiers of India are defined largely by the Himalayan mountain range, where the country borders China, Bhutan, and Nepal. Its western border with Pakistan lies in the Karakoram range, Punjab Plains, the Thar Desert and the Rann of Kutch salt marshes. In the far northeast, the Chin Hills and Kachin Hills, deeply forested mountainous regions, separate India from Burma. On the east, its border with Bangladesh is largely defined by the Khasi Hills and Mizo Hills, and the watershed region of the Indo-Gangetic Plain.

- The Ganga is the longest river originating in India. The Ganga–Brahmaputra system occupies most of northern, central, and eastern India, while the Deccan Plateau occupies most of southern India. Kangchenjunga, in the Indian state of Sikkim, is the highest point in India at 8,586 m (28,169 ft) and the world's third highest peak. The climate across India ranges from equatorial in the far south, to alpine and tundra in the upper regions of the Himalayas.

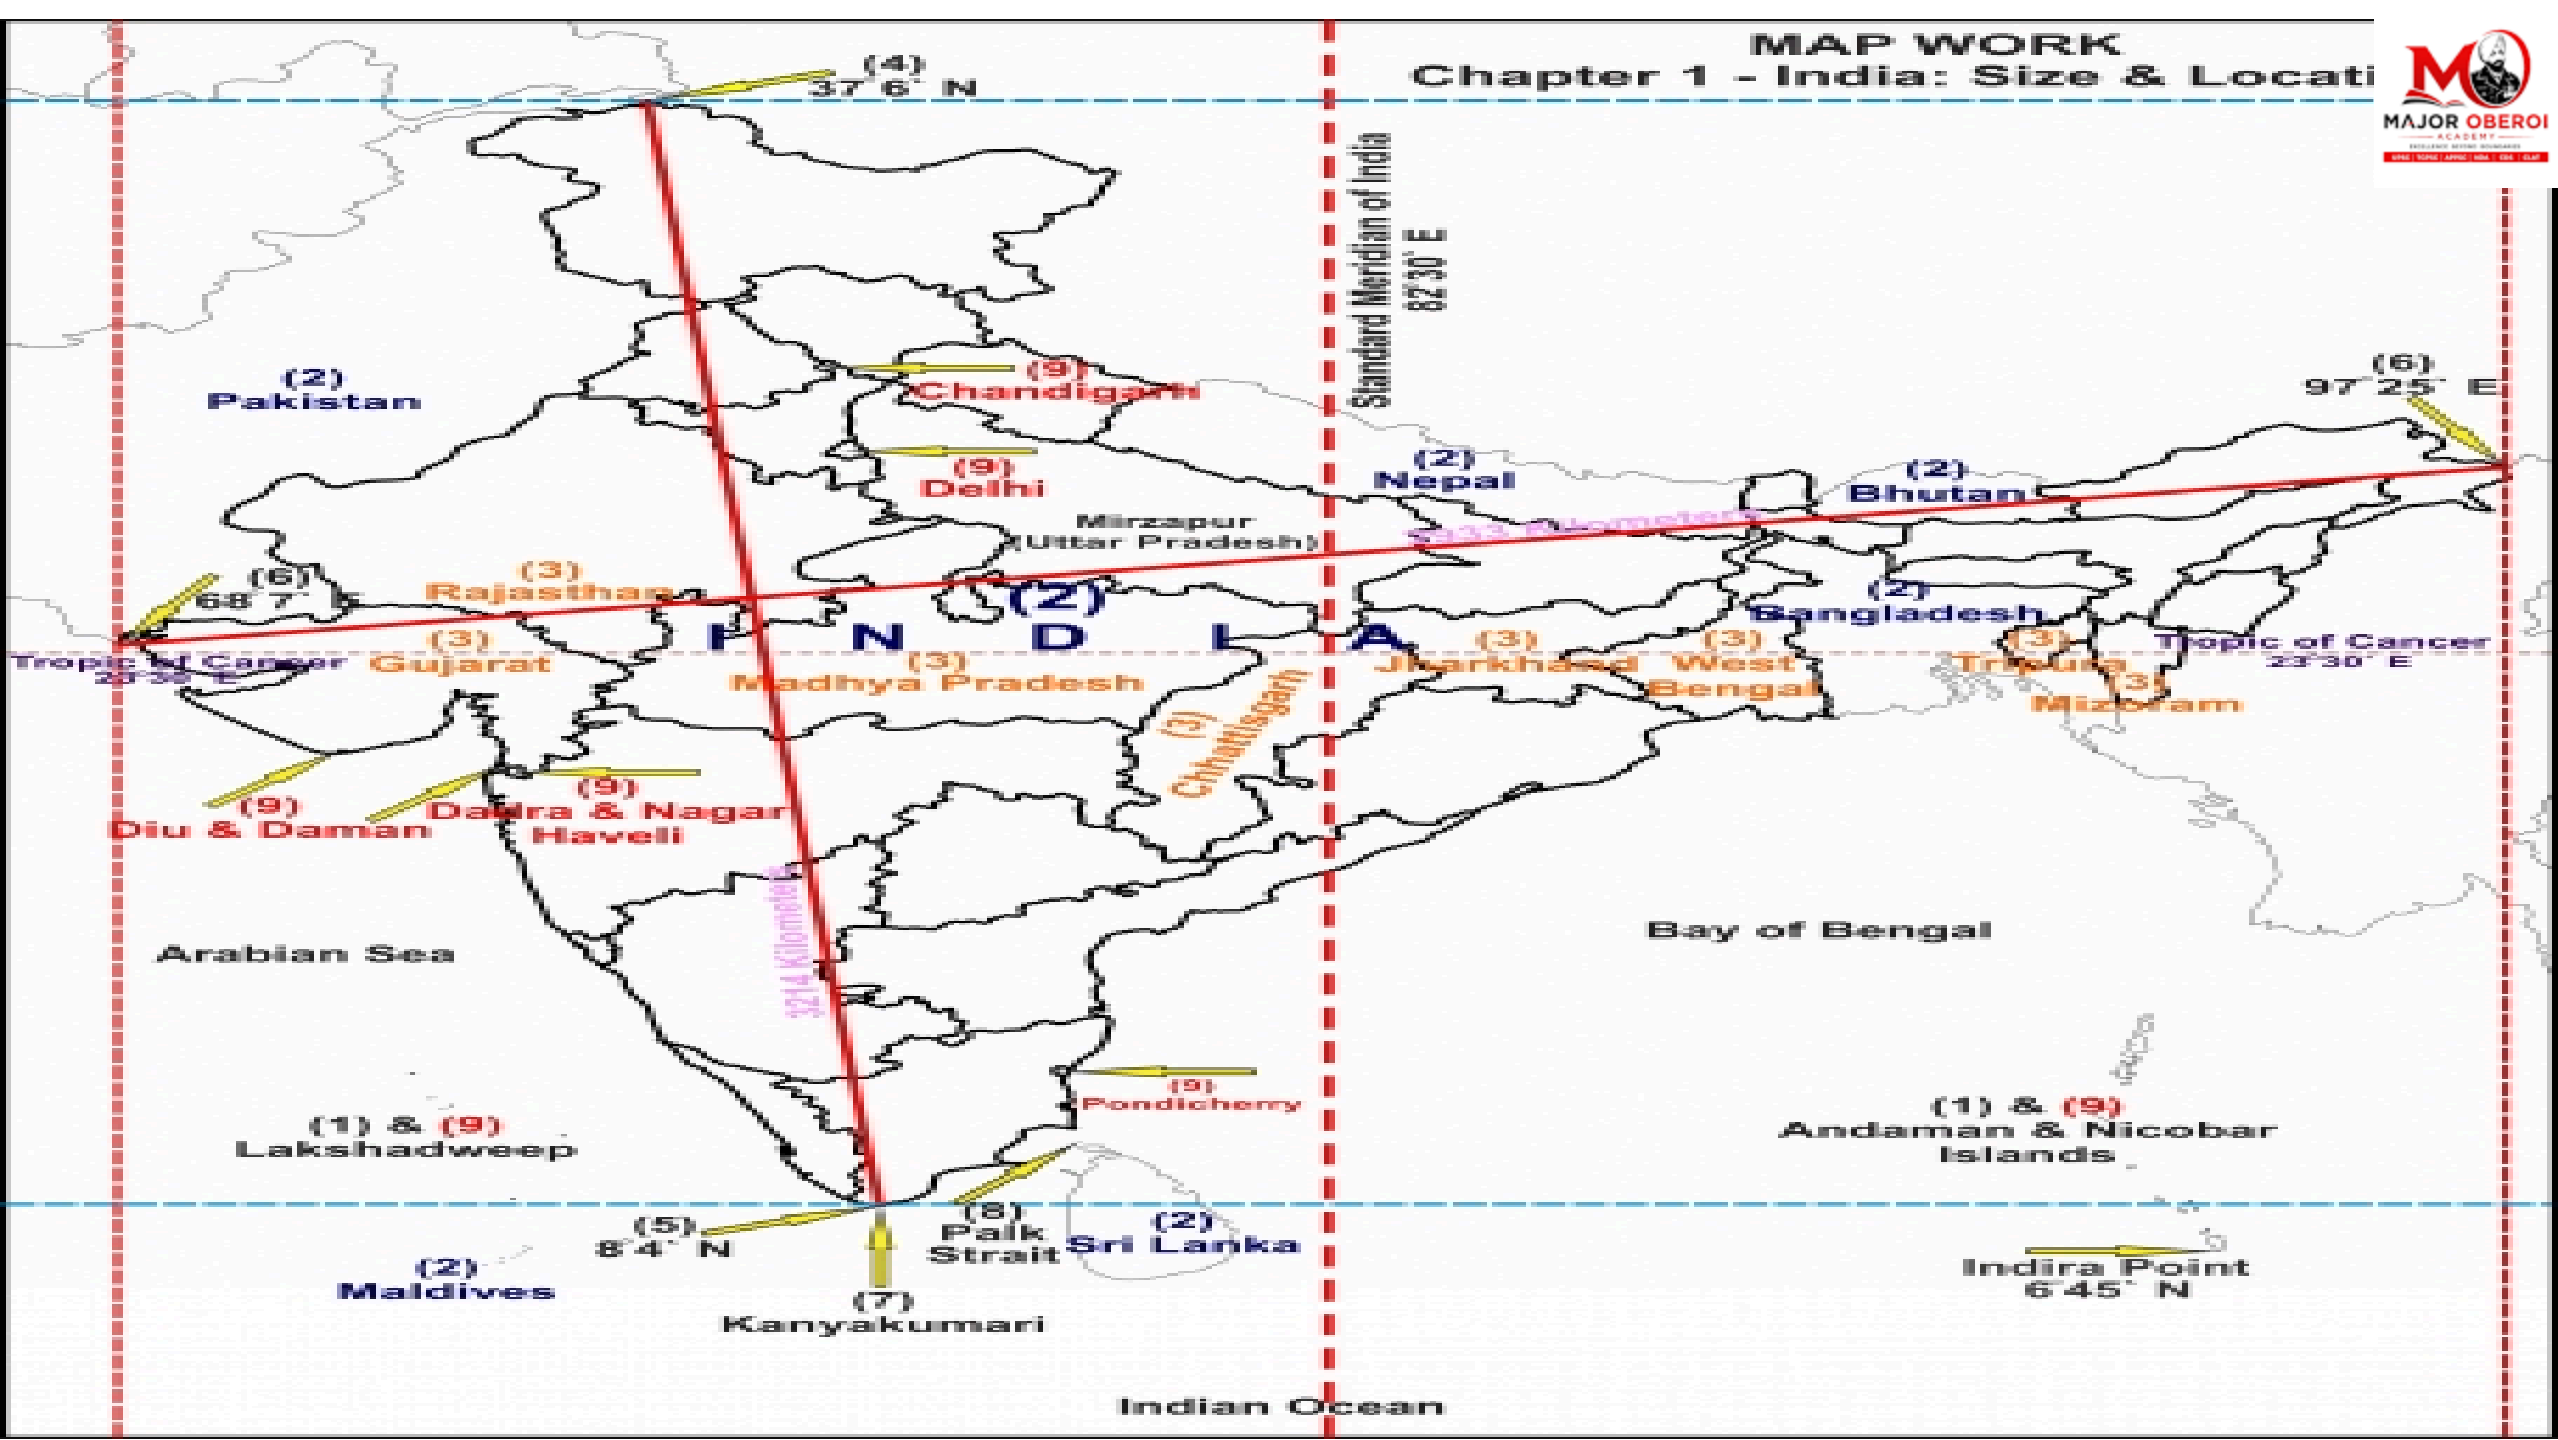

- **The longitudinal extent and its implications**:
- The longitudinal extent of India is 30 degrees. As the sun rises in the east and sets in the west; it takes 4 minutes for the sun to move across 1 longitude.
- Thus, the easternmost point of India would be 2 hours ahead of the westernmost point (30 x 4 = 120 minutes), in accordance with the local time.

- This difference in time might create confusion in air and rail timings and so many other things across the two states. To avoid this confusion, 82°30' East longitude is taken as the Standard Time Meridian of India and its local time is taken a standard throughout the country.

- **The latitudinal extent and its implications**:
- The difference between the length of day and night in southern most part of India is much less only about 45 minutes as they are situated near the equator. This difference between day and night in the northern parts of India steadily goes on increasing till it becomes as much as 5 hours.

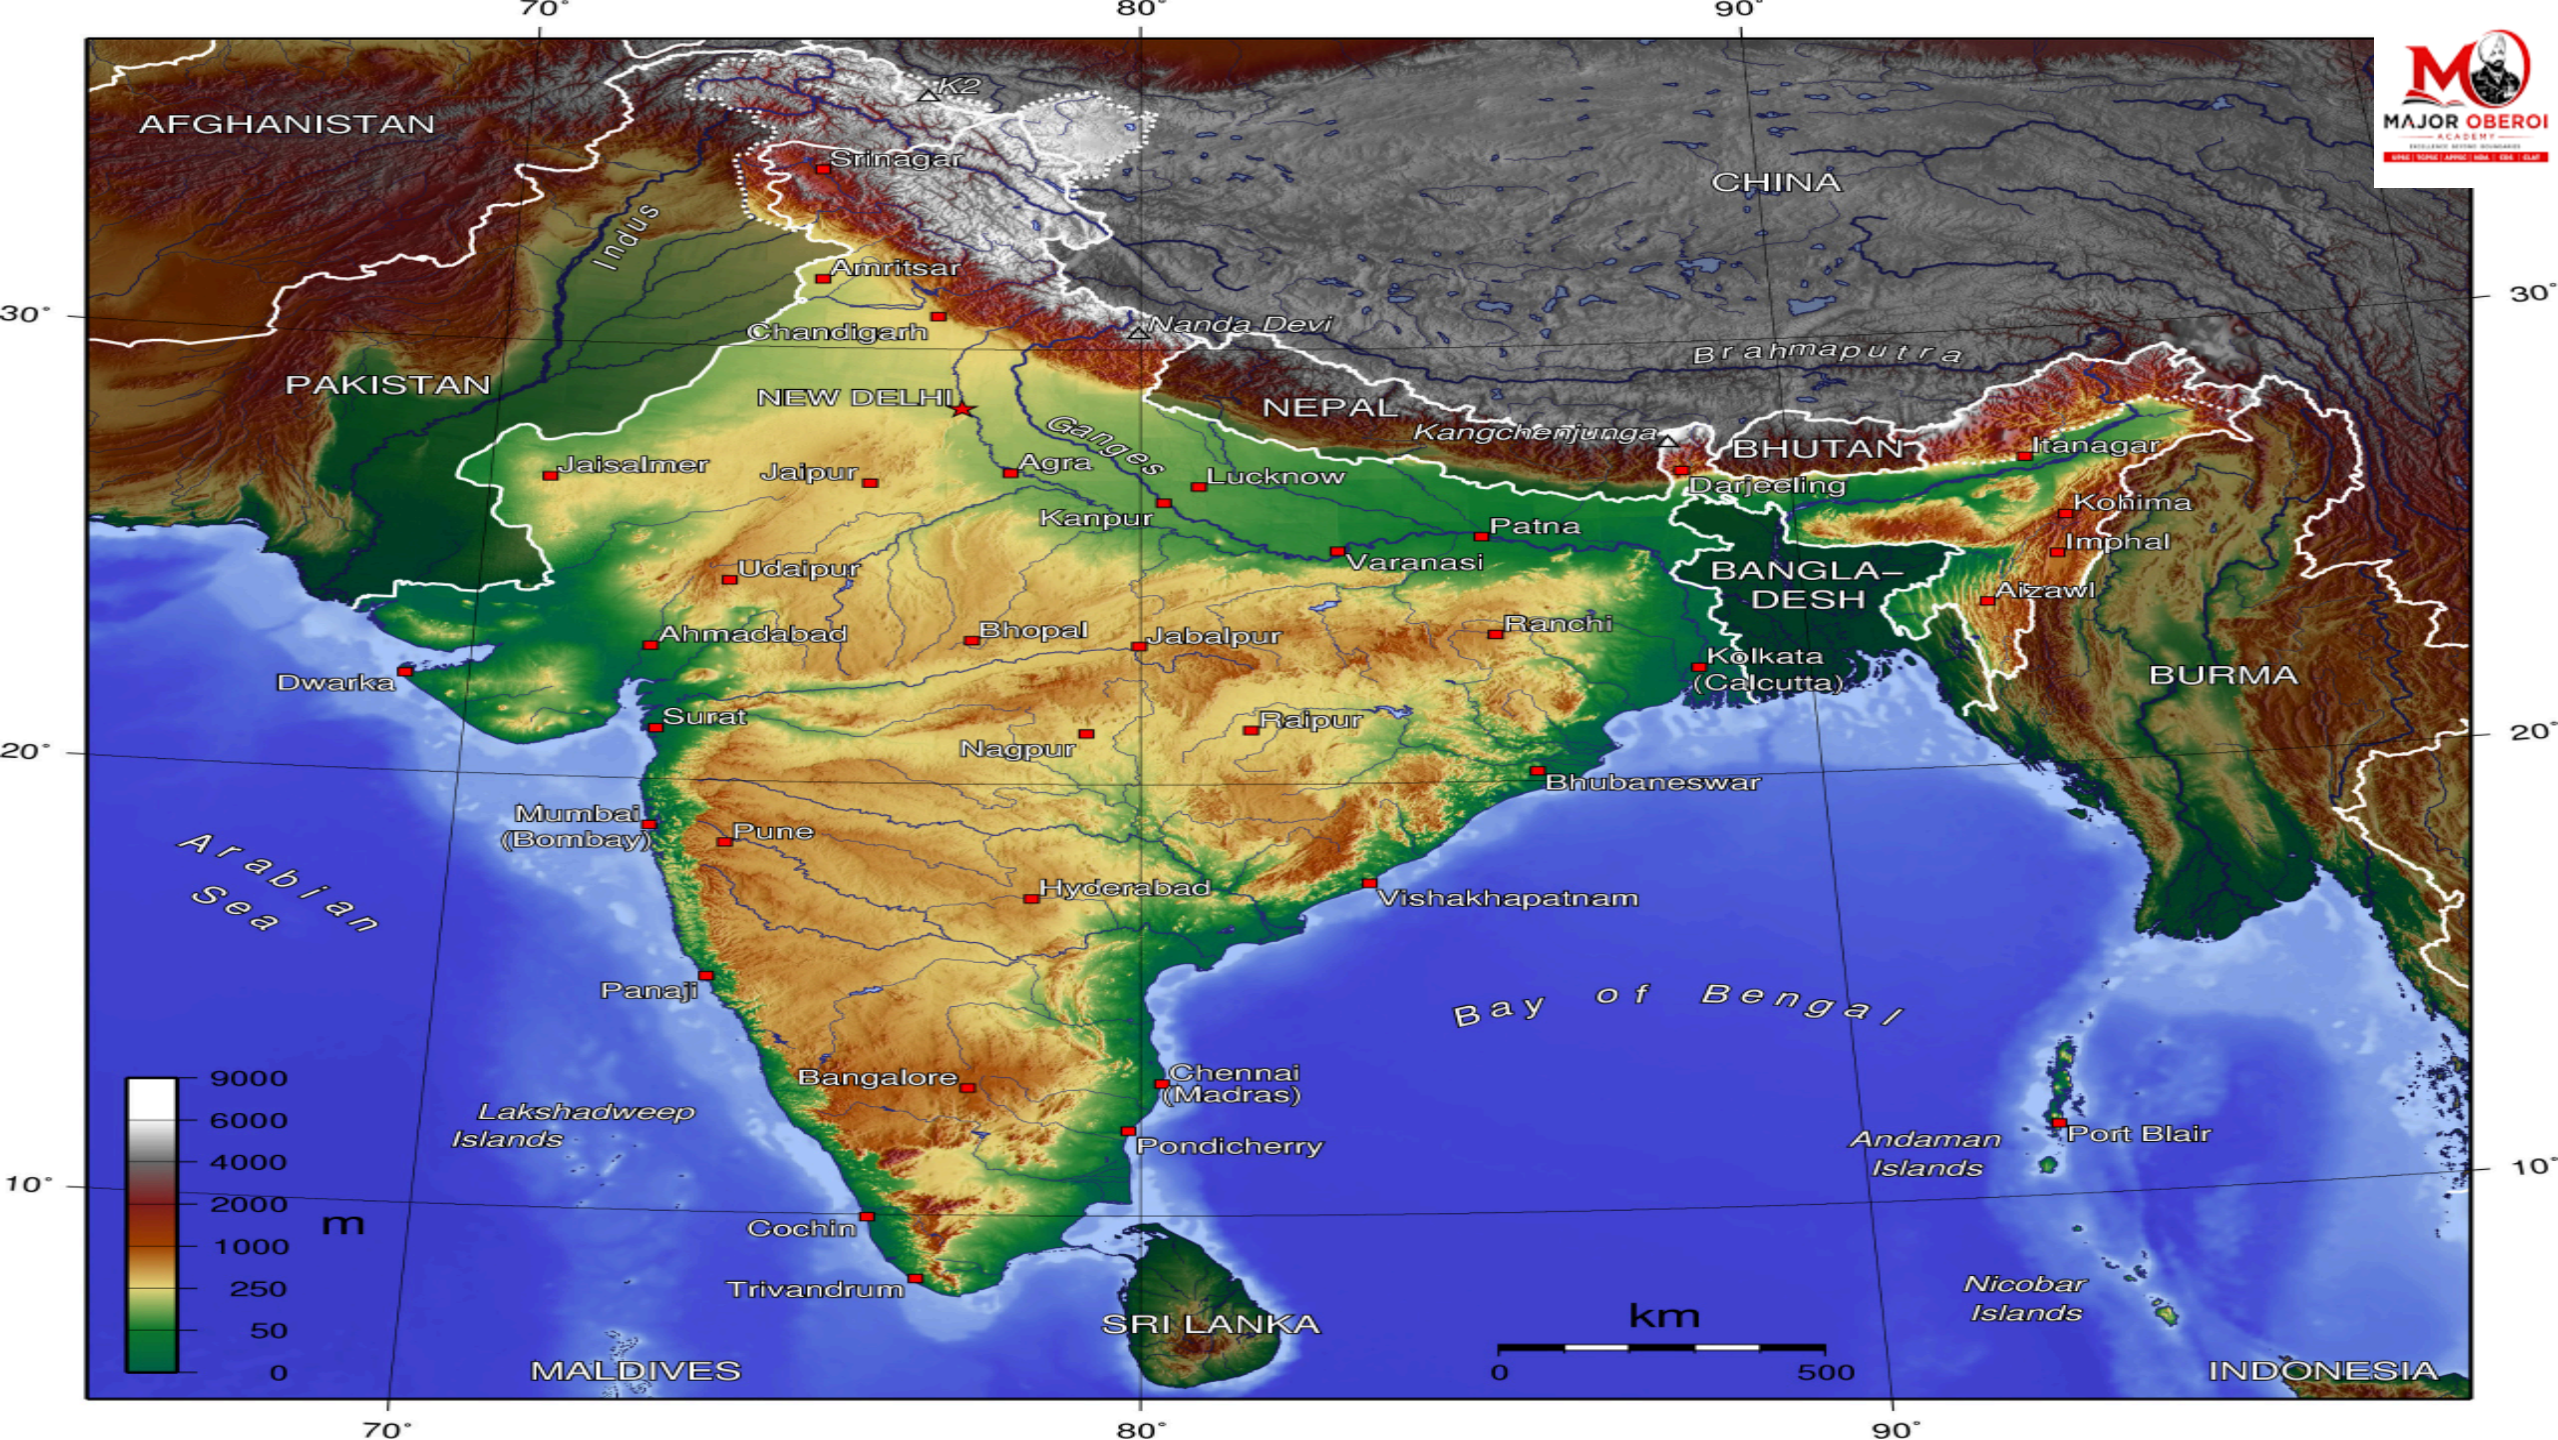

- The Tropic of Cancer passes almost halfway through the country. Thus half of the country to the south of the Tropic of Cancer is situated in the Tropical or Torrid zone and the other half lying north of the Tropic of Cancer falls in the Subtropical zone. This location is responsible for large variations in landforms, climate, soil types and natural vegetation in the country.

- Areas closer to the coast would experience greater rainfall
- And, as we move towards the interior areas, the moisture content of clouds and hence the rainfall experienced would decrease.
